Abstract (en)

[origin: EP0795662A1] The automobile lock (10) has a cylindrical stator (12) with an axis (A1). The stator is open at its front axial end to enable mounting of a rotor (16). The lock has a stop which axially retains the rotor at the stator rear. A cover (46) axially closes the stator front end. A ring (26) axially locks the rotor at the stator front. The ring is fixed in the stator by a bayonet fitting having two radial lugs (28) which are engaged in stator housings (30) by rotating the ring. The stator cover prevents the ring lugs from leaving their housings and unlocking the ring.
