Abstract (en)

[origin: EP0796972A2] The joint seal has foam contained in the seam between the frame and the masonry, while the frame (1) has a peripheral rib (7) at the indoor side at least. The flange (8") at the indoor side of the component (8) is thicker than that (8') at the other side. The flange contains a groove (10), and in this a spring elastic sealing lip (11) is accommodated and which bears with its free end against the masonry (5). It is secured by a holding component pressed into the groove. There can be a further peripheral rib at the outside, with a channel-section component fitting over it and likewise accommodating a sealing lip.
