Abstract (en)

[origin: EP0797178A1] The system has several modems (10,50,60) forming a group of defined size. Each modem has at least one input (90-93) which can be connected to an alarm state detector (20), a first memory (100) contg. the addresses of the security monitoring modems corresp. to the group, a second memory (110) contg. an identification message and a programmable controller (120). The programmable controller automatically selects an address from the first memory in response to a signal from the detector and sends the message in the second memory to the selected modem. The controller responds to a received identification message by driving a device to output an alarm signal and a display to show the message.
