Abstract (en)

[origin: EP0798536A2] The device comprises an explosive charge (3) which is located in a one-sided closed tube (1), in which a drive charge (2) is arranged. The drive charge impels the explosive charge out of the tube into the avalanche slope. The drive charge is placed between the base (11) of the tube and the explosive charge. The base of the tube is releasably inserted in it. The tube is provided with an explosive cartridge (10), which contains both the drive and the explosive charges. The cartridge has a tubular housing (21) in which the two charges are located. Between the two charges is a plate (20) of rigid metal.
