Abstract (en)

[origin: WO9620046A1] Acoustic ring-shaped transducers comprising a set of piezoelectric prestressed segments are described. According to the invention, said segments (101) are grouped to form a set of sectors (102) separated by clamping wedges (109). The set of sectors is placed in a forming ring (108) and the wedges are drawn towards the centre by screws (111) so as to urge the sectors against said forming ring and to pre-stress the segments. Stress gauges (107) are used to control and adjust the resulting stress to a required value while minimising dispersion between sectors. The invention is useful for producing low frequency, powerful, detachable acoustic transducers.
