Abstract (en)
[origin: DE4445891A1] A process is proposed for breaking down cellular tissue and releasing the constituent cells or cell groups by incubating the cellular tissue with a recombinant neutral protease from Clostridium histolyticum. The protease in question is coded by (a) a DNA of the nucleotide 1027-1965 from SEQ ID NO:3 or by a DNA complementary to it; (b) nucleic acids which hybridise with a DNA of the nucleotide 1027-1965 from SEQ ID NO:3; (c) nucleic acids which would hybridise with one of the nucleic acids mentioned in (a) or (b) without degeneration of the genetic code. The protease is a product of a prokaryotic or eukaryotic expression of an exogenic nucleic acid. Incubation continues until the release of cells or cell groups in the desired quantity and separation of the cells or cell groups from the cellular tissue fractions.
