Abstract (en)

[origin: WO9620302A1] A method is disclosed of producing cellulose fibres or yarns with a reduced tendency to form fibrils. This is done by treating fibres or yarns which have undergone washing after the yarn-forming process but are not yet dried with a cross-linking agent; the fibres or yarns are treated using amino-, polyalkylene oxide, epoxy- or carboxyl functionally modified reactive polysiloxanes which are subjected to a self-cross linking. The process is especially suitable for use with fibres manufactured by the N-methylmorpholine-N-oxide (NMMO) process.
