Abstract (en)

[origin: EP0799939A2] The drainage channels on the plate are covered with a fluid-permeable and particle-blocking material. The cross-sectional form of the drainage channels (5), together with their arrangement over their longitudinal axis, as well as their arrangement and positioning in relation to one another and to the plate (1), can accommodate relative movement. The arrangement in the union with the building outer wall may act as a heat-insulation, sealing and drainage layer. There is a direct communication between the drainage channels of adjacent plates for the purpose of unhindered fluid discharge. The drainage channels are open at least at one end. They have at least one inlet aperture on their cover surface for accommodation of the fluid being discharged.
