Abstract (en)
[origin: EP0799950A1] The shuttering panel, especially for concrete structures, consists of a metal sheet (2) equipped with a series of regularly-spaced lengthwise supporting beams and transverse templates (1), e.g. at the top and bottom, to vary the curvature of the metal sheet. The templates are pressed against the surface of the metal sheet by fastenings (8) and adjusted by means of regulating elements (4, 5, 6, 7). The templates can be made from wood, plastic or nylon, and each one has a central groove for a seal.
