Abstract (en)

[origin: DE4447165A1] The proposal concerns a switching device for locking systems, especially for motor vehicle locking systems with a lock to actuate the switching device by means of which it is also possible, in particular, to switch power currents and which, besides the control by the lock, permits control by an electronic control unit (14). Such a switching device can be produced comparatively economically by the provision of a mechanical central switch (1) and an electric motor (2), in which the electric motor (2) can be controlled via the lock and the central switch (1) is mechanically connected to the electric motor (2).
