Abstract (en)

[origin: EP0801167A2] A machine for the single-twist stranding of cables composed of a plurality of wires, particularly for large-diameter cables, comprising a winder frame (2) which is rotatably supported about its own axis (2a) and a winder reel (3) which is arranged inside the winder frame (2), the winder reel (3) being rotatably supported about its own axis, which substantially coincides with the axis (2a) of the winder frame (2). The winder frame (2) and the winder reel (3) can be rotatably actuated about their common axis (2a) independently of each other. The winder frame (2) has at least one guide (4) forming a path for a cable (5) to be stranded which runs from a feed area (6) for feeding the cable to be stranded, located proximate to the axis (2a) of the winder frame (2), to a region (7) laterally spaced from the axis (2a) of the winder frame (2) and laterally facing the winder reel (3), the path being inclined with respect to the axis (2a) of the winder frame (2) at least along part of its extension starting from the feed area (6). <IMAGE>
