Abstract (en)

[origin: EP0801298A1] Method of controlling a steam cracking process for which a material X is a feed in order to keep substantially constant the value  $V_c$  of a property P of said feed, or the yield of said process, which method comprises measuring the absorption  $D_{ix}$  of said material at more than one wavelength in the region 600-2600nm, comparing signals (i) indicative of said absorptions or a mathematical function thereof with signals (ii) indicative of absorptions  $D_{im}$  at the same wavelengths or a mathematical function thereof for at least 2 standards  $S_m$  for which the said property or yield has a known value V, at least one of said standards  $S_{mc}$  having a value  $V_c$  for said property or yield and controlling said process to ensure that said standard  $S_{mc}$  or standard(s)  $S_{mc}$  is the standard or standards having the smaller or smallest average value of the absolute difference at each wavelength i between the signal for said material and the signal from the standard  $S_m$ . <IMAGE>
