Abstract (en)

[origin: WO9713317A1] Projections (15a), semi-projections (16a), and recesses (18a) all having a width of an electrical angle of 120 DEG are provided to the periphery of a conductor disk (15) which rotates synchronously with a motor. A coil (10a) which only faces the projections (15a) and another coil (10b) which faces the projections (15a) and semi-projections (16a) are fixed to a fixed armature. Three-phase position detecting signals are generated in accordance with the changing mode of impedance when the coils (10a and 10b) face the periphery of the disk (15).
