Abstract (en)

[origin: EP0804052A2] The energy supply has a resonance transducer supplied from a DC voltage source, with a reactance (3) and the cold cathode lamp (4) connected in series in the load circuit. The control stage has a regulator (2) determining the amplitude and/or pulse ratio of the lamp current generated by the end stage (3), dependent on the lamp temperature and/or the detected light output level, provided by a measuring stage (5). The output can be provided by a switched rectifier which rectifies the output signal and periodically reverses the polarity supplied to the lamp.
