Abstract (en)
[origin: WO9622178A1] To produce bearing components from channels (12), the latter are laid one behind another on a working surface (2) to form a plurality of adjoining sections (13) with at least one continuous hollow chamber (14) until a predetermined section (13) length is attained, whereafter reinforcement (16) is inserted into at least one hollow chamber (14) of each section (13), concrete (17) is poured into the chambers (14) containing the reinforcements and bearing components of predetermined length are cut from the sections (13) after the concrete (17) has set. To permit the production of the bearing components while saving time, power and effort with low investment costs, the channels (12) are arranged on the working surface (2) by a fixed placement station (11) and the working surface (2) is moved through the placement station (11) with the channels (12) placed thereon.
