Abstract (en)
[origin: WO9603558A1] The invention relates to a stair component (16) for renovating an overhanging step (10) with a tread (12) and a riser (14) comprising a single or multi-part cladding (18, 28, 42) covering the tread and riser with a section (28) running along the riser and covering it at least partly. To facilitate renovation using structurally simple means with easy matching to steps of differing height, it is proposed that the longitudinal edge (30) running parallel to the step (10) section (28) covering the riser (14) in sections terminate at a distance from the underside (48) of the overhanging stair and an L-shaped bent finishing component (42) with an arm (46) (transverse arm) extending as far as beneath the step extend from the longitudinal edge.
