Abstract (en)

[origin: WO9521305A1] A process and device are disclosed for lining a static support (1) with plastic boards (2). The plastic boards (2) are linked to the static support (1) by a plurality of anchors (3) with a mounting technique that compensates during mounting for thermal expansion differences that cause the displacement of the positions of the board holes and anchors (3). In spite of the plurality of anchoring points, a uniform flank contact between the board (2) and the anchor (3) is ensured at all fastening points. Static calculations concerning the fastening points may thus be performed. Special measures are proposed in order to reduce the forced material stresses in the plastic boards (2) due to differential expansion.
