Date Feb. 13, 1997A photoelectric path- and angle-measurement system for measuring the displacement of two objects relative to one another comprises a quantity  $N=n \times 4$  of photoreceivers which are arranged in a photoreceiver matrix in such a way that the diagonals of the photoreceivers lie parallel to the diagonals of the photoreceiver matrix and the photoreceivers which detect the same phase position are electrically connected with one another, and these signals are fed to an evaluating circuit.
