Abstract (en)
[origin: DE19501268A1] The invention concerns a device for measuring rotary movements comprising essentially the following elements: a signal transmitter (10) which rotates with the object; a stationary measured value transducer or sensor (7); and a sensor housing (6, 6') which houses, positions and secures the sensor (7) and into which the sensor can be inserted. The sensor housing (6, 6') is a rotationally symmetrical body such as a deep-drawn metal unit. The sensor housing (6, 6') is provided with a flange (11, 11') which when the sensor is inserted and rotated engages with a flange (12, 12') on the sensor and is positioned.
