Abstract (en)

[origin: EP0805420A2] The method involves preparation, printing out a document including address field and notes, scanning of the notes in a post position, data processing and franking. Postal items are detected in the path to the franking machine. Data are accessed in the franking machine according to the detected address and/or notes and the resulting printing data automatically entered into the franking machine. Print images specific to the originator can be accessed in a second step involving the alteration of data in non-volatile memory. The third step involves processing the data and accounting before franking.
