Abstract (en)

[origin: WO9622888A1] Apparatus for holding a set of punched sheets of paper or like material together consists of a foldable base member (111) with on one side of the fold (106) elongate tabs (103) which can pass through pre-punched holes in a stack of paper, and on the other side of the fold (106) channels (below 104) into which the free ends of the tabs (103) can be inserted via apertures (at 105). The tabs (103) can slide in the channels and do so as the base member is folded or opened out flat. Preferably the hinging arrangements hold the base member preferentially flat or folded over completely, rather than in any intermediate position. This can be achieved using moulded live hinges, e.g. in polypropylene.
