Abstract (en)

[origin: EP0806163A1] The device has a first guide part (7), which is pivotable around the vertical axis (13) and is provided with a linear guide for the installation part (1). The device has a further guide part (14), through which the installation part is guided against tipping during displacement. Stop devices prevent a pivoting of the installation part in the pushed-in state and only release in the fully withdrawn position. They prevent the inward movement of the installation part when it is also only slightly pivoted. The further guide part has a guide rail (12) fixed to the one side wall (6) of the cabinet component which has a first linear guide track, along which first guide components (16) fixed to the installation part are movable. The second linear guide track (25) travels on the second guide components (22). The guide components, guide tracks and stops work together to provide the locking mechanism.
