Abstract (en)

The present invention relates to a device for fixing delivery units such as pumps, valves and the like, onto the flanged necks of flasks and the like, having the special feature that it comprises a sleeve which can be applied to a flanged neck of a flask and housing inside it a delivery unit. Said sleeve has a cylindrical lining projecting axially with respect to the flanging of the neck. There is also provided a washer with a cylindrical rim which can be engaged with the free edge of said lining so as to cause, upon axial compression of said sleeve, the deformation of the material forming the free edge of said lining with its consequent compaction underneath said flanging. <IMAGE>
