Abstract (en)

[origin: EP0806391A1] A conveyer (10) feeds a continual supply of a print product e.g. poster to the base of a stack (16). The uppermost poster is lifted from the stack by a suction pad (18) fixed to a rotating wheel and into the radius (48) of action of a rotating finger (38) lift assembly (36). The finger lift assembly is synchronised with the suction pad movement. The suction pad releases the poster the rear edge (34) of which is then impelled by the recess (46) at the base of the rotating finger onto a conveyer (52) and forming a regular formation (S2).
