Abstract (en)

[origin: EP0806610A2] The method uses a regulation circuit, receiving an ionisation signal ( $U_i$ ) from an ionisation electrode, for regulation of the gas/air ratio to provide a required lambda value corresponding to a required ionisation signal value ( $U_{is}$ ). The regulation is effected within a limited regulation range (RB), for ensuring acceptable emission levels, the upper limit ( $U_{io}$ ) of this range lying below the maximum value of the ionisation signal and the lower limit ( $U_{il}$ ) lying above the dangerous emission level. A cut- out signal for the burner is provided when the ionisation signal is outside the regulation range for longer than a given interval.
