Abstract (en)

[origin: EP0806784A2] The switching device (1) has movable lines (2) for providing electrical connections with the terminal clamps of an immediately adjacent switching device within the switch cabinet. The lines are movable along a defined linear path relative to the switching device, with all lines mechanically coupled together so that they are moved in common. The lines may be mounted on a common carrier (6) which is displaced parallel to the side faces (10,11) of the switching device.
