Abstract (en)
A universal lamp-holder comprises a casing (11) defining chambers (13, 14) which house elastic contact elements (18, 19) for electrical connection with the pins of a light bulb. Each contact element (18, 19) has opposing surfaces (20, 21) defining a channel between them with its inlet end facing out from the lamp-holder through a coupling aperture (16, 17) to receive a light bulb pin. Screws (34, 35) are disposed at right angles to the extension of the contact surfaces and push the opposing surfaces towards each other to grip a pin inserted in the channel. <IMAGE>
