Abstract (en)
[origin: DE19504464C1] Disclosed is a sporting good with an oblong, plate-like base body (10), the underside of which is essentially smooth in the front area (13) and in the rear area (14) and has a runner system in its central area (15). This runner system comprises two curved outer runners (16) that extend essentially in the longitudinal direction of the base body (10), have a convex inside lateral face and protrude from the underside of the base body (10), adjoining the lateral edges thereof; two curved inner runners (17) that extend essentially in the longitudinal direction of the base body (10), have a convex inside lateral face and a concave outer lateral face and protrude from the underside of the base body (10) between and at a distance from the outer runners (16), and a stabilizing runner (18) that extends along the longitudinal midline of the base body (10) between the inner runners (17) and projects from the underside of the base body, the outer runners (16) being shorter than the inner runners (17), which in turn are shorter than the stabilizing runner (18). This sporting good is characterized in that the stabilizing runner (18) extends from approximately the midpoint of the base body (10) to approximately the back end of the inner runners (17), that the distance between the convex inside lateral face of an outer runner (16) and the concave outer lateral face of the inner runner (17) facing it is smaller in back than up front, and that the outer runners (16) are wider than the inner runners (17).
