Abstract (en)

[origin: EP0809229A2] A drive for a matrix of light emitting devices includes a plurality of column decoding switches (12) each including a plurality of column circuits, each circuit coupled to an individual column and a power source (50). An individual data line (C0 - C59) coupled to each decoding switch (12) for selecting and activating a specific decoding switch (12). A plurality of column address lines (A0 - A1) coupled to each of the decoding switches (12) for logically selecting a specific circuit. Similar row decoding switches (15) are optionally connected to the rows of the matrix and to a current sink (51) and similarly addressed. Whereby one contact of a selected LED is coupled to the current sink (51) by an addressed one of the row coupling circuits (15) and a second contact of the LED is coupled to the power source (50) by the addressed one of the column coupling circuits (12).
