Abstract (en)

[origin: EP0810137A1] The shell (Cv) of the vehicle bears upon the cross-beam (Tc) through a ball-bearing ring (Cr). The cross-beam is coupled by secondary suspension (Su) to the lateral casings (Pr1,Pr2) of the beam of a reduction bridge implemented in three parts. This bridge combines the functions of a load-carrier, an axle drive and a transmission for the torque from the traction motor(s), whose axes are parallel to the axle. The motor(s) may be flanged to the beam of the bridge or may float with respect to it.
