Abstract (en)
The present invention provides a valve (10) comprising a stem (11), a housing (12) and a blocking means (20). The stem (11) is movable within the housing (12) to allow the opening and the closing of the valve (10). The stem (11) comprises a discharging opening (14) connected to a discharging channel (15), whereby the discharging channel (15) is located on one end of the stem (11). The housing comprises an orifice. The blocking means (20) prevents the opening of the valve (10) when the discharging channel (15) is in an undesired orientation. The blocking means is separated from the discharging opening (14). The blocking means (20) is located at the other end of the stem (11) opposed to the discharging channel (15).
