Abstract (en)

[origin: WO9627017A1] The present invention provides a method of producing a modified recombinant protein in a host cell using a single vector containing in tandem both the nucleotide sequence encoding an exogenous protein and an enzyme specific for modification of that protein. The invention also specifically provides a method of producing a recombinant phosphorylated human protein in a bacterial system using a single vector containing in tandem the nucleotide sequence encoding the human protein and a human kinase specific for phosphorylation of that protein.
