Abstract (en)

[origin: WO9627541A1] The device proposed is intended to enable a product under pressure in one container to be introduced simply and without handling problems into a container fitted with a nozzle valve, the contents of the second container also being under pressure. Attached to the top of at least the first container (1, 2) is a tubular adapter (5, 6) which surrounds the valve (3, 4) on the first container and is designed as a guide element to enable the top of the second container (2, 1) to be set on the first and displaced axially.
