Abstract (en)
[origin: WO9725502A1] The invention relates to a process for programming secondary portable stations which communicate with a fixed main station. The process can be used, in particular, in drives for garage and other doors of places to which several people have access. For programming it is necessary merely to place a first secondary station against the fixed main station, whereupon said secondary station becomes the master secondary station for the further programming of slave secondary stations. It is thus possible easily to program further slave secondary stations from the master secondary station which is characterized by a corresponding indication.
