Abstract (en)  
[origin: DE19507852C1] A door locking device has several closing rods that co-operate with closing recesses or closing elements on the body of a cabinet and that may be moved by a lock from open positions into closed positions and vice-versa. The number of closing points can be increased by simple, commercially available locks and bolts, as pairs of closing rods form the push rods (21.2; 22.1; 21.2; 22.2) of at least two push rod locking devices and in that the push rod locks (20.1; 20.2) carry additional pinions (23.1; 23.2) that are mutually coupled by a coupling rod (30) with teeth (31, 32) and can be moved in the same direction.
