Abstract (en)

A cushion plate unit 50 is constructed by a body plate 51 and a feed roller plate 52, on which a feed roller 9 is contacted. The feed roller plate 52 has at a location downstream from the feed roller 9 in the direction of the movement of the fiber bundle a projected portion 56 for deflecting the movement of the fiber bundle in a direction away from the cushion plate for generating a first area for imparting a frictional force in the fibers in the fiber bundle. A deflector plate 16 is arranged downstream from the projected portion 56 for causing the fiber bundle to be deflected in a direction toward the cushion plate for generating a second area for imparting a frictional force in the fibers in the fiber bundle. Due to the increase in the frictional force, fiber bundles not nipped by detaching rollers 3 and the feed roller 9 are prevented from being entrained by the fibers nipped by and moved by the detaching rollers 3 during the detaching process, thereby reducing an amount of long fibers included in a waste. <IMAGE>
