Abstract (en)
[origin: EP0816611A2] The plate has a bar which forms an opening (6) for a locking pin at one end, and which can pivot on the plate at its other end. The opening lies in a defined position relative to the edge of the plate when the bar is swung in, and this position can be adjusted. The adjustment may be achieved using a stop (13) against which the edge region of the opening acts under gravity, when the bar swings in. The edge of a shoulder which surrounds the opening may rest on a slope (11) or recess, in order to ensure this gravity action.
