Abstract (en)

[origin: EP0816632A1] The device for transmitting information between the bottom of a shaft and the surface, where the shaft comprises a series of tubes separated into a lower and an upper part by means (9) of shutting off the internal space in the tubes and annular means (6) of sealing between the tubes and the shaft. The lower part contains a first assembly containing a data acquisition unit and means of transmitting and receiving electromagnetic signals, and a second assembly (2) for transmitting and receiving electromagnetic signals is placed inside the upper part by means of manoeuvre (3) containing at least one electrical or optical link to the surface. The second assembly has electrical contact with the tubes. Also claimed is the method of transmitting information between the bottom of a shaft and the surface using the equipment described above.
