Abstract (en)

[origin: WO9630293A1] The invention concerns a device for receiving or taking over winding cores (18) for any type of continuous fabric, in particular without motion rods, with two spaced radius arms (1) each carrying a sheath guide (6) for the winding cores (18), a cutter bar (9) for separating the fabric, a bearing device (10) for feeding onto the empty winding core (18), and a sheath or winding core feed unit (15). In order to fulfil a precise function with a very simple design, in particular for retrofitting existing facilities in which continuous fabrics are handled for whatever purpose, the device is designed in such a way that the sheath guide (6) and cutting bar (9) and the layering apparatus (10) are allocated to the radius arm (1) so that they are capable of being tilted together at a predetermined angle.
