Abstract (en)

[origin: EP0818395A1] The inside of the cap (3), especially on the rim (5) of its closure side facing away from the orifice in an operating position, has an inward protruding peripheral reduction (6) in diameter or cross-section, so as to form a seal with the outside of the tube in a closed position. The cap material is harder and or the cap wall thicker, at least near the reduced diameter part than the outlet tube (2) near where the reduced diameter part rests. the outlet tube at least is made of cold-flow plastics under pressure, so that the reduced diameter part on the outside of the tube forms a permanent annular groove (7).
