Abstract (en)

[origin: WO9727790A1] The object of the invention is to provide a solid, easy to assemble, low manufacturing cost structure of modular rack container for bottles. Said structure consists of two frames (1 and 2) of intersected drawn steel obtained by an electrowelding process to be linked together through predrilled linking elements (8 and 9) - preferably of wooden construction - by means of protrusions of some rods of the frames (6, 7a and 7b). The rear frame, designed to be at lower level to house the bottles downwards, is provided with horizontal transverse bars between each row (5) in order to align and stop the bottles. The other object is to provide a modular rack container extensible in different forms and dimensions - both horizontally and vertically - extremely "flat" before assembling, thus requiring little space in shipping and storing.
