Abstract (en)

[origin: WO9631671A1] The invention concerns a support device for at least one elastically deformable securing element (2) such as a wire cable loop, for securing building components such as precast concrete parts, in particular as a concrete connection for section concreting. The device is provided with at least one support box (1) and means for bending the securing element (2) and means for positioning the securing element in relation to the support box. The bending means comprise at least two bending stops (40, 42) and a counter stop (41). In order to simplify handling, specifically the assembly of such a support device, at least one moulded element (3, 3a) is provided which serves as a positioning means and has a bending stop (40). This moulded element is or can be clicked into the support box (1) in a way which makes it angularly rigid. The bending stop (40) of the moulded element counteracts any bending forces which arise, at least parallel to the surface of the component to be secured. The support box can hold one part of the elastically deformable securing element (2) until the component can be stripped of the outer shell.
