Abstract (en)
[origin: DE19604105A1] An ignition device (11) for a multicylinder internal combustion engine must be designed so that it is operationally reliable under shaking accelerations of the internal combustion engine. The ignition device (11) has rod-shaped ignition coils (12) corresponding to the number of cylinders of the internal combustion engine. An end section (22) of each ignition coil (12) is formed by a part of a core (23) of the ignition coil (12) projecting from a housings (20) of the ignition coil (12). A buffer is arranged on this. The other end section (21) of the ignition coil (12) is formed by a high voltage dome (27) which is contained in a socket (39) of elastic material supported in the spark plug bore (15) of a cylinder head (13) of the internal combustion engine. The ignition device (11) is maintained elastically tensioned at the two end sections (21, 22) in the cylinder head (13) of the internal combustion engine by a retaining element (33). The high voltage transmission to an associated ignition coil (16) is effected in a flexible manner through a high voltage contact element (48) which is designed as a spring.
