Abstract (en)
[origin: EP0819395A2] The shelving comprises a support bearing (2) for the shelf board and holders (4) extending parallel to the support bearing at a distance from it so that a coupling socket is formed to hold the edge of the board between support bearing and holder. The holder and support bearing are connected together by a web (6) which has a socket (3) for a wall fixture. The support bearing and holder can each be formed by open hollow bodies (7,8) so that recesses are formed without rear cut sections in a single injection moulding process. The shelf holder can be comfortably moved along the slide face.
