Abstract (en)

[origin: EP0819404A2] A decorative panel (1) to be mounted on the door (2) of a built-in appliance is provided with coupling members suitable to allow the vertical sliding thereof along the door (2), as well as with a device which, when the door (2) is closed, allows to lock the sliding of the panel (1) alternatively in an upper position and a lower position through the interaction between a guide plate (7) and a support plate (5) on which a substantially T-shaped rod (6) is pivoted whose free end (6a) moves within a track formed in the guide plate (7). The support plate (5) is secured on the panel (1) and the guide plate (7) is embedded into a seat (8) formed in the upper portion of the door (2), the seat (8) having such a depth as to allow the mounting of the panel (1) on the door (2) with a very small play whereby the free end (6a) of the rod (6) always remains engaged in the track of the guide plate (7). <IMAGE>
