Abstract (en)
[origin: EP0819640A2] The toothed cutter (13) is arranged at a distance from the periphery of the storage roll (5) on the roll support (3) and in pressure engagement with the foil strip (9) penetrates across its complete width. A covering for the cutter for use when the device is not in use is operated by a strip section drawn out from the storage roll and is raised directly before and during the sepn. process. The sepg. component (11) is foldably supported around a pivot axis parallel to the rotary axis of the storage roll and by means of a stirrup (16) operated by a drawn-out strip from the storage roll is movable from a protected non-use position into an operating position with the cutter exposed. In the operating position with continued withdrawal of the strip section locating on the stirrup the penetration of the strip at the engagement line of the cutter takes place.
