Abstract (en)

[origin: EP0819807A1] The inner space (4) of the hollow shaft (2) is freely accessible via an opening (15). The opening in the head (1) is closable by a closure cap. This cap is formed by two covers (7,8) on both sides of the head (1) and joined outside the opening. The covers are pivotable around link axes (16,17) running parallel to one another and are securable to one another in the closed state with the aid of inter-engaging locking components arranged in planes of the covers running parallel to the longitudinal axis of the hollow shaft. The first lock is formed by at least one projection arranged in an extended area (18) of the first cover (7) and the second lock is formed by at least one recess in the area of a cut-out (19) of the second cover (8).
