Abstract (en)
[origin: EP0819813A2] The lock has a handle-operated locking element (2) and an electromagnet (7,7a) used as a retaining magnet which can block or release the locking element via control and blocking elements. The handle operates a control plate (4) as well as the locking element. The control plate moves a transverse plate (5) via a cam (4b). The transverse plate is coupled to a blocking plate (6) with a drive channel engaged by the drive pin (2c) of the lock. The electromagnet's yoke and coil are mounted on the blocking plate.
