Abstract (en)
[origin: EP0820082A2] The switching device has a housing with at least three contact points. These are formed of at least one movable contact member and at least one fixed contact member. The contact points are arranged separated from each other in parallel switch tracks. The movable contact members are actuated by an associated control member (12,14,16) e.g. a rocker switch, movable about a pivotal axis. The control member moves the associated movable contact member from a first switch position to a second switch position. A control member (12,14,16) is associated with each switch track with associated contact points. The control members are actuated independent of adjacent control members. All of the control members (12,14,16) have a common pivot axis. Each control member has switch cams (18) to each actuate a contact point.
