Abstract (en)

[origin: WO9632607A1] By means of a temperature detector (10), the temperature is measured inside a cell box (3) which is in communication with the tank (1). When the level of liquid inside the cell box reaches a minimum level (LM), the temperature detector (10) is surrounded by steam, the temperature of which is higher with respect to the temperature of the liquid, and enables liquid supply by means (30) for feeding liquid to the cell box (3), thus replenishing the tank up to an operational level (LO), when the liquid enters the cell box, it cools the temperature detector which disables the liquid feeding means (30), cutting off inflow of cold liquid to the cell box (3).
